

Platform User Guide

*Your new website and staff platform — a plain-language guide
for the people who run it day to day.*

Prepared June 21, 2026 · freshstartbhinc.com

CONFIDENTIAL — FOR FRESH START BEHAVIORAL HEALTH

Fresh Start Behavioral Health — Platform User Guide

A plain-language guide to your new website and staff platform. Written for the people who will run it day to day — no technical background assumed.

1. What you have

Your new platform is one connected system with four parts:

Area	Who uses it	What it's for
Public website	Anyone on the internet	Your marketing site — services, providers, locations, insurance, reviews, blog, contact
Admin Portal	Your staff	Edit the website, manage providers/reviews, handle form submissions and intakes, run the practice
Patient Portal	Existing patients	Secure messages, appointments, refill requests, documents, and billing statements
Intake Portal	Prospective patients	A guided new-patient sign-up they can complete (and pause/resume) on their own

There is also a **Analytics Dashboard** for leadership (KPIs and trends, no patient details).

Everything shares one design and one database, so a change you publish in the Admin Portal appears on the public site immediately.

2. How to sign in

Each area has its own separate login. Bookmark the ones you use.

Area	Web address
Admin Portal	https://freshstartbhinc.com/admin/login
Analytics Dashboard	https://freshstartbhinc.com/dashboard
Patient Portal	https://freshstartbhinc.com/patient-portal/login
Intake (new patients)	https://freshstartbhinc.com/intake

Two-step login (MFA). Staff and patient logins use an extra security code from an authenticator app (Google Authenticator, Authy, Microsoft Authenticator, etc.). On your first login you'll be shown a QR code to scan once; after that the app generates a fresh 6-digit code each time. Keep your phone handy when you sign in.

Starter accounts. The system ships with one demo account per staff role and a demo patient account, all using a placeholder password. **These must be changed before real use** — see the launch checklist in Section 9.

3. Staff roles — who can do what

Access is controlled by role, so people only see what their job needs. The six roles are:

- **Administrator** — full access, including staff user management and security settings.
- **Clinical Director** — clinical oversight, providers, intakes, incidents.
- **Compliance Officer** — audit log, incident reports, compliance views.
- **Receptionist / Front Desk** — appointments, form submissions, day-to-day front-office work.
- **Provider** — provider-facing views.
- **Billing Staff** — billing and insurance-related views.

If someone can't see a page or button they expect, it's almost always a role permission — an Administrator can adjust it under **Users**.

4. Running the website (Admin Portal)

After signing in at `/admin/login` you land on the admin home. Key sections:

Pages & content

- **Pages** — edit the content of marketing pages using a block editor (headings, text, images, sections). Save as a **Draft**, **Preview** exactly how it will look, then **Publish** when ready. Drafts are never visible to the public.
- **Providers** — add or update your clinicians: name, photo, bio, specialties, locations.
- **Testimonials / Reviews** — approve and manage the patient reviews shown on the site.

Front-office work

- **Submissions** — appointment-request and insurance-verification forms that visitors send from the public site. These are stored encrypted; opening one is logged.

- **Forms** — manage the public-facing form definitions.
- **Intake** — review new-patient intake packets submitted through the Intake Portal (full detail in Section 7).

Oversight & administration

- **Incidents** — log and track incident reports.
- **Audit** — a permanent, read-only record of who did what (logins, edits, who opened which patient record). This cannot be altered or deleted — that's by design, for compliance.
- **Users** — (*Administrator only*) add staff, set roles, deactivate people who leave.
- **Security** — (*Administrator only*) manage your own two-step (MFA) setup and security settings.

Tip — the publish workflow. Nothing you type goes live until you click **Publish**. Use **Draft** → **Preview** → **Publish** for anything customer-facing so you can check it first.

5. The Patient Portal

Patients sign in at `/patient-portal/login` (with two-step verification) and can:

- **Messages** — secure, private messaging with your team.
- **Appointments** — view their scheduled visits.
- **Refills** — request prescription refills.
- **Documents** — view and download documents you've shared, and upload their own (e.g., insurance cards). Every upload is virus-scanned and encrypted before it's stored.
- **Billing** — view statements.
- **Security** — manage their own two-step login.

For privacy, the portal **automatically signs a patient out after 15 minutes** of inactivity. Sensitive health information is encrypted, and every time a record is opened it's recorded in the audit log.

6. The Intake Portal (new patients)

Prospective patients start at `/intake` and move through a guided, multi-step form (history, insurance, consent, e-signature).

Two things make it patient-friendly:

- **Save and resume** — they can stop partway and pick up later using a link emailed to them plus a private resume code, so nothing is lost.

- **It's separate from the Patient Portal** — they don't need an account first.

When they finish, the packet arrives **encrypted** in your **Admin** → **Intake** queue for your team to review and act on. As with all patient data, access is logged.

7. Analytics Dashboard (leadership)

At `/dashboard`, authorized leaders see practice health at a glance:

- Appointment and conversion numbers
- Medicaid mix and patient-satisfaction measures
- Six-month trend lines
- Provider, incident, and compliance panels
- Intake funnel and CARF-related indicators

Important: the dashboard shows **aggregate numbers only** — no individual patient information ever appears here.

8. Security & compliance — please read

This platform was built to be **HIPAA-conscious**, with strong technical safeguards:

- Sensitive patient data is encrypted with bank-grade (AES-256) encryption, on top of the database's own encryption.
- Every access to patient information is recorded in a tamper-proof audit log.
- Two-step (MFA) login on all staff and patient accounts.
- 15-minute automatic sign-out on the Patient Portal.
- All uploaded files are virus-scanned before they're stored.
- The public Contact form carries a notice telling people **not** to send health details through it.

The one thing you must do before going live with real patient data

HIPAA-conscious is not the same as HIPAA-compliant. True compliance requires a signed **Business Associate Agreement (BAA)** with **every outside vendor that touches patient data** — your hosting, database, file storage, and email providers. These agreements are usually a paid/enterprise feature and are **not** included on free plans.

- The **public website, content editor, and admin tools never handle patient health data** — these can launch right away.

- The **Patient Portal and Intake Portal do collect real health data. Do not turn these on for real patients** until either (a) BAAs are in place with every vendor in that path, or (b) intake/portal data is routed through a dedicated, BAA-covered clinical/EHR vendor.

Your technical team has this flagged as a hard launch gate. Please confirm BAA terms directly with each vendor before collecting any real patient information.

9. Going live — checklist

The platform is fully built and tested. These remaining steps require **your** accounts, domain, and vendor decisions, and are handled by whoever deploys the site:

1. **Change all starter passwords** and remove or rename the demo accounts (one per role + the demo patient).
2. **Connect your domain** and turn on the security/firewall layer.
3. **Set up the vendor accounts** for hosting, database, file storage, and email — and **sign the BAAs** before enabling patient features.
4. **Turn on the virus scanner** for uploads (required before accepting real patient files).
5. **Confirm analytics** (your existing Google Tag Manager is already wired in; decide whether to keep the older Google Analytics stream too).
6. **Submit the new site map to Google** and spot-check that old web addresses redirect to the new ones.

A detailed, technical version of these steps lives in `DEPLOY.md` for your developer/IT contact.

10. Day-to-day quick reference

I want to...	Go to
Edit a web page	Admin → Pages → edit → Preview → Publish
Add/update a clinician	Admin → Providers
Approve a patient review	Admin → Testimonials / Reviews
See appointment & insurance requests	Admin → Submissions
Review a new-patient intake	Admin → Intake
Add a staff member or change a role	Admin → Users (<i>Administrator</i>)
See who accessed what	Admin → Audit
Check practice KPIs	Dashboard
Reset my two-step login	Admin → Security (or Patient → Security)

Need help?

For technical questions, vendor setup, or anything in the launch checklist, contact your developer/IT partner and point them to `README.md` and `DEPLOY.md` in the project. This guide covers everyday use; those cover the technical operation.
